Emotional Image + Voiceover Reel System

A complete step-by-step guide to creating emotional short-form reels from topic to finished video, using AI for every stage.

Includes: category picker, topic generator, voiceover script prompt, voice generation workflow, image prompt system, and assembly checklist.

1. How the System Works

- Every reel in this system follows the same pipeline. You do not need to be a writer, designer, or editor. You only need to follow the order and use the prompts exactly as written.

1. Pick a category (emotional theme).
2. Generate 10 topics inside that category and pick one.
3. Generate a voiceover script from the topic.
4. Turn the script into a voiceover audio file.
5. Generate image prompts, one per scene, from the script.
6. Generate the images with a fixed character.
7. Assemble the video with the voiceover, images, and captions.
8. Export in vertical format and publish.

- Each reel is roughly 30 to 45 seconds. One reel takes about 45 to 90 minutes the first few times and under 30 minutes once you have a routine.

What you need

- An AI chat assistant (any capable model) for categories, topics, scripts, and image prompts.
- A text-to-speech tool for voiceovers, such as ElevenLabs. Menu names change, so check the current interface.
- An image generator that accepts text prompts and can produce 9:16 (vertical) images.
- A video editor for assembly, such as CapCut or any editor that supports vertical 1080 x 1920 exports.
- Optional: royalty-free background music with a calm, emotional tone.

Golden rules

- Follow the order. Do not skip the topic step or write images before the script is final.
- Use one fixed character description for every reel in a series. Never rewrite it.
- Keep voiceover length between 30 and 45 seconds.
- One scene per line of narration. Images must match what is being said.

2. Step 1: Pick a Category

- A category is the emotional theme your reels will sit under. Start with one category and keep it for a full series so your audience knows what to expect.

Categories included in this system

1. Loneliness and feeling alone
2. Family and parents
3. Friendship and lost friends
4. Love and heartbreak
5. Self-worth and confidence
6. Grief and missing someone
7. Struggle and never giving up
8. Childhood memories
9. Gratitude and small everyday joys
10. Festivals and seasons (for example, Diwali, Pongal, or New Year)

Category picker prompt (paste into your AI assistant)

```
You are helping me choose a category for an emotional short-form video series.
Show me these 10 categories as a numbered list with one line describing the emotion
of each:
1. Loneliness and feeling alone
2. Family and parents
3. Friendship and lost friends
4. Love and heartbreak
5. Self-worth and confidence
6. Grief and missing someone
7. Struggle and never giving up
8. Childhood memories
9. Gratitude and small everyday joys
10. Festivals and seasons

Ask me which number I choose. Do not generate anything else until I reply.
```

- Tip: choose the category your target audience feels most strongly about. Festival categories work best when the posting date is near that festival.

3. Step 2: Generate 10 Topics and Pick One

- Once you have a category, use this prompt to generate 10 specific topics. Each topic includes a hook, the emotion, and the closing message, so you can judge quality before you commit.

Topic generator prompt

```
The category is: [PASTE YOUR CATEGORY HERE]

Give me 10 topics for 30 to 45 second emotional reels in this category.
For each topic, provide:
- Topic title (5 words or fewer)
- Opening hook (one line that works in the first 3 seconds)
- Core emotion (one word)
- Closing message (one line)

Rules:
- Make each topic specific and relatable (a real moment, not a general idea).
- Avoid clichés such as "life is short" or "never give up" as the topic itself.
- Vary the situations so no two topics feel alike.
- Output as a numbered list.
```

How to choose the best topic

- Pick the topic where you can picture a specific person in a specific moment.
- The hook should make a viewer want to hear the next line.
- The closing message should be something a viewer might share or comment on.
- Avoid topics you cannot connect to visually. Every line must be illustratable.

4. Step 3: Write the Voiceover Script

- The voiceover script is the spoken narration. It has a hook, short story lines, and a closing line. Keep every line short so the voice sounds natural and each line can match one image.

Voiceover script prompt

```
Write a voiceover script for an emotional vertical reel.

Topic: [PASTE YOUR CHOSEN TOPIC]
Category: [PASTE YOUR CATEGORY]
Language: [e.g., English, Telugu, Hindi, or any language]
Tone: calm, warm, reflective

Structure:
1. Hook: one short line (first 2 to 3 seconds)
2. Story: 4 to 5 short lines, each telling one moment in sequence
3. Closing: one line that lands the emotion

Rules:
- Total length: 70 to 110 words, which reads in 30 to 45 seconds.
- Use short sentences. No sentence longer than 15 words.
- Write in first person or simple present tense.
- No hashtags, emojis, stage directions, or titles inside the spoken text.
- Mark a short pause with [pause] where it helps the emotion.

After the script, provide a numbered scene list. For each line of the script,
give one scene number and a 1-line description of what the viewer should see.
Output the script first, then the scene list, as plain text.
```

Script check before you move on

- Read it aloud once. If you run out of breath, shorten the sentence.
- Confirm there are 5 to 7 scenes. Fewer feels rushed. More feels cluttered.
- Make sure the closing line repeats or completes the emotion from the hook.
- Lock the script. Any change after image generation means regenerating images.

5. Step 4: Generate the Voiceover

- Paste the final script into your text-to-speech tool and generate the audio. These settings are a starting point for a calm, emotional narration. Adjust by listening to the first output.

Recommended starting settings (ElevenLabs-style controls)

- Voice: a warm, calm, natural voice. Choose one voice and use it for the whole series.
- Stability: around 50 percent. Lower sounds more expressive; higher sounds more steady.
- Similarity: around 75 percent.
- Style or expressiveness: low to moderate (about 20 to 35 percent) so the voice does not sound theatrical.
- Speed: 0.9 to 1.0. Slightly slower feels more emotional.
- Language: match the script language exactly. For Telugu or other scripts, check pronunciation of names and place words.

Generation workflow

1. Paste the script with [pause] markers removed. Replace each [pause] with an extra line break or a comma.
2. Generate the audio once. Listen from start to finish.
3. Fix mispronounced words by spelling them phonetically in the text, then regenerate.
4. Export as MP3 or WAV at the highest quality available.
5. Save the file with the topic name, for example: 03-grandmas-voice-v1.mp3.

Voiceover quality check

- Final length between 30 and 45 seconds.
- No robotic breaks between sentences.
- Emotion matches the topic. If it sounds cheerful for a sad topic, regenerate with lower expressiveness.

6. Step 5: Create the Character and Image Prompts

- Consistency is what makes a series look professional. Create one character description once, then paste it unchanged into every image prompt.

Step 5a: Set your locked character

- Write one character description once. Paste it unchanged into every image prompt.
- Keep the same face, hair, outfit, and body proportions in every scene.
- Example of a locked character (replace with your own):
- Style: stick-style cartoon boy, round white face, simple dot eyes, small smile, small ears.
- Hair: black, messy, swept back.
- Outfit: black short-sleeve t-shirt, blue rolled-cuff denim shorts with pockets, white low-top sneakers.
- Body: long thin white arms and legs, often with hands in pockets.
- Art style: clean bold black outline, flat white fill, plain light background.

Character generator prompt (optional, if you need a new character)

```
Create a fixed character description for a recurring character in a vertical
emotional reel series.
Give me bullet points for: age range, hair, face, clothing with exact colors,
build,
and one signature detail. Make it specific enough that an image generator produces
the same person every time.
```

Step 5b: Generate image prompts from the voiceover scene list

```
Create one image prompt per scene for a 9:16 vertical emotional reel.

Locked character description (copy exactly, do not edit):
[PASTE YOUR LOCKED CHARACTER DESCRIPTION]

Art style (copy exactly): [e.g., soft cinematic realism, warm film grain, muted
colors]
Setting palette: [e.g., warm evening light, dusty colors, shallow depth of field]

Scene list from the voiceover:
[PASTE YOUR SCENE LIST]

For each scene, output:
Scene number
Image prompt, following this order:
1. Aspect ratio: 9:16 vertical
2. Character and action (use the locked description, then describe what the
character is doing)
3. Setting and props
4. Lighting and mood
5. Camera: close-up, medium, or wide, and the angle
6. Art style (copy exactly)
7. Negative: no text, no captions, no logos, no watermarks, no extra people
```

```
Keep each prompt under 120 words. Output as a numbered list.
```

7. Step 6: Generate the Images

- Generate every scene image from its prompt. Work in order and keep track of which scene number each file belongs to.

Image generation workflow

1. Generate the first scene image. Check that the character matches your locked description.
2. If the face or clothing drifts, regenerate with the same prompt. Do not rewrite the character.
3. Once scene 1 is approved, use it as a reference image for the other scenes if your tool supports it.
4. Generate all remaining scenes. Keep a folder with the naming pattern: 03-scene-01.png, 03-scene-02.png.
5. Check each image for text, watermarks, or extra limbs. Regenerate any image that has them.

Image quality check

- Same character in all scenes (face, hair, clothing).
- Images are vertical (9:16) and sharp enough to fill a phone screen.
- Each image shows the moment described in its narration line.
- No text inside the images. Captions are added in the editor.

8. Step 7: Assemble the Reel

- Assembly combines the voiceover and images into a final vertical video. The rule is simple: each image stays on screen for the length of the narration line it illustrates.

Choose your own editing app

- Use the editing app you already know best.
- Any app that supports vertical 1080 x 1920 export works, such as CapCut, Premiere Rush, DaVinci Resolve, or an Android or iPhone built-in editor.
- The steps below are app-neutral. Find the matching button in your app.

Assembly steps

1. Create a new project with a vertical canvas: 1080 x 1920, 30 frames per second.
2. Import the voiceover audio and place it on the audio track.
3. Import all scene images in order.
4. Trim each image so it starts when its line begins and ends when the next line starts. Use the audio waveform to find the timing.
5. Add a slow zoom (Ken Burns effect) to each image. Keep zoom slow and subtle.
6. Add a short crossfade of about 0.3 seconds between scenes.
7. Add captions that match the voiceover exactly. Use a clean font with high contrast and keep captions inside the safe area.
8. Add background music at about 15 to 20 percent of the voiceover volume. The voice must always be clearly audible.
9. Add a final 1 to 2 second hold on the closing image.
10. Export as MP4, 1080 x 1920, at the highest quality setting.

Assembly checklist

- Total length 30 to 45 seconds.
- Image changes line up with the narration.
- Captions are readable on a phone with sound off.
- Music never covers the voice.
- Export at 1080 x 1920, MP4, with the highest quality setting.

9. Step 8: Review, Name, and Publish

Final review

- Watch the full reel once with sound on and once with sound off.
- Confirm the hook appears in the first 2 to 3 seconds.
- Confirm the closing line lands on the final frame.

Naming and organizing

- Use a numbered format so your series stays organized: 01-topic-name-final.mp4. Keep the script, voiceover, image prompts, and images in one folder per reel.

Publishing

- Post to the platform where you have the most engagement first, then cross-post the same file.
- Write a short caption that restates the emotion in one line. Add 3 to 5 relevant hashtags.
- Post on a consistent schedule. Three to four posts per week is a practical starting point.
- Track which categories and hooks get saves, shares, and watch-through. Use that data to choose the next category.

Building a 30-reel series

1. Choose one category for the whole series, or two closely related categories.
2. Generate 10 topics, then pick 10 different ones for reels 1 to 10 and repeat the process for reels 11 to 30.
3. Reuse the same voice, character, art style, and caption style across all 30 reels.
4. Batch the work: write 5 scripts in one session, generate 5 voiceovers, then move to images.

Appendix: Quick Prompt Reference

- Copy these into your AI assistant in order. Replace the bracketed fields with your own content.

1. Category picker

```
Show me these 10 emotional categories as a numbered list, with one line for each.
Ask me to choose one number, then wait.
```

2. Topic generator

```
The category is [CATEGORY]. Give 10 specific, non-cliched topics for 30 to 45
second emotional reels. For each: title, hook, core emotion, closing message.
```

3. Voiceover script

```
Write a 70 to 110 word voiceover script on [TOPIC] in [LANGUAGE]. Hook, 4 to 5
short story lines, closing line. Short sentences. No hashtags. Then give a numbered
scene list.
```

4. Locked character

```
Describe one recurring character in one paragraph: age, hair, face, clothing with
colors, build, one signature detail. Output only the paragraph.
```

5. Image prompts

```
For each scene, write a 9:16 image prompt. Use this locked character exactly:
[CHARACTER]. Art style: [STYLE]. Include action, setting, lighting, camera, and
negative prompt (no text, logos, or watermarks). Under 120 words each.
```
